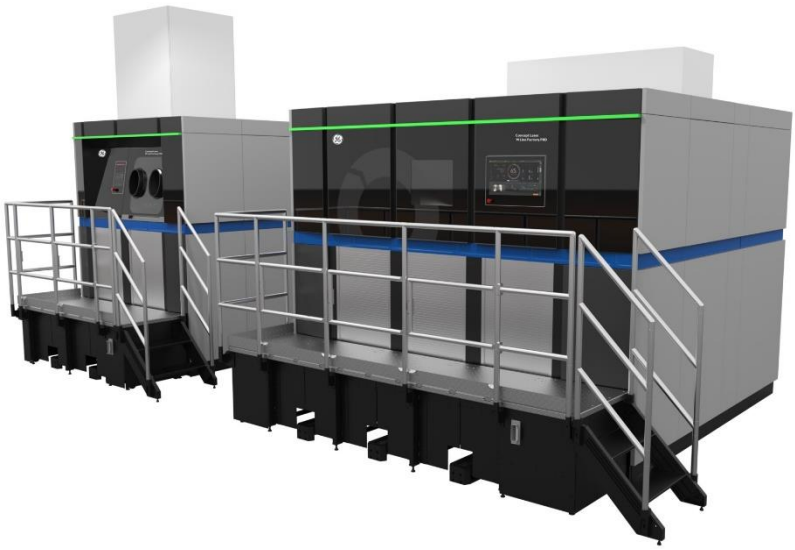
M Line Nickel 718

Parameter for GE Additive's Concept Laser M Line

Data in this material datasheet represents material built with 50 µm layer thickness and in a nitrogen atmosphere on a Concept Laser M Line machine. Values listed are typical.



Nickel 718

Nickel chromium superalloys like 718 are often used in high-stress, high-temperature aeronautical, petrochemical and auto racing environments. The excellent high temperature strength and creep resistance derive from precipitation hardening of finely dispersed precipitates. Next to that Alloy 718 is a metal that is also highly resistant to the corrosive effects of hydrochloric acid and sulfuric acid. The favorable weldability of Alloy 718 makes this alloy suitable for additive manufacturing as well. Typical applications are high-quality components designed for thermally challenging environments such as rocket engines, gas-turbine hot sections, and heat exchangers.

M Line Nickel 718

The Alloy 718 parameters for the Concept Laser M Line is developed leveraging the performance of the previous machine generations. The balanced parameters deliver good surface quality while maintaining a very good density. The parameter has been optimized for use of steel blade recoater. The parameter meets the minimum tensile properties specified in ASTM F3055 for additive manufactured parts in the heat treated state.

MACHINE CONFIGURATION

- M Line
- Nitrogen gas
- Steel recoater blade

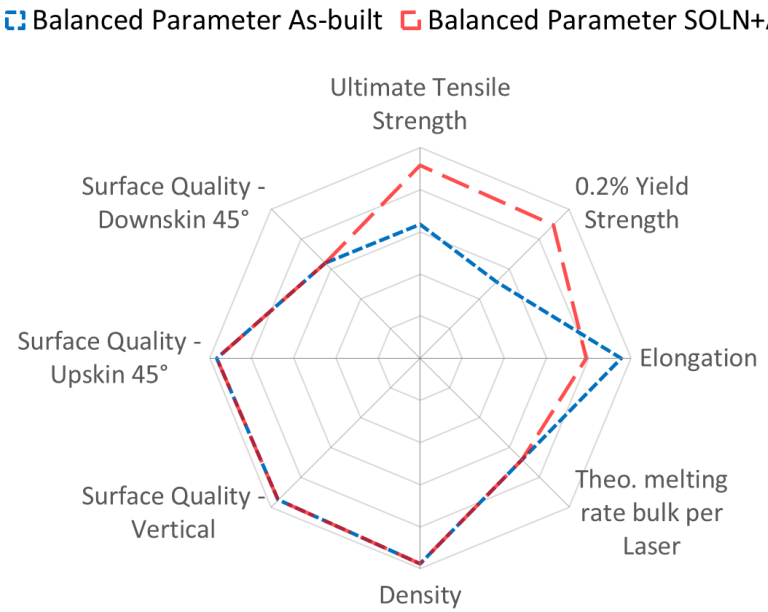
AVAILABLE PARAMETER

- **Balanced Parameter 329/330** 50 µm layer thickness, Rubber recoater
- **Balanced Parameter 380/381** 50 µm layer thickness, Steel recoater

THERMAL STATES

1. As-Built
2. Solution + Age (SOLN+AGE)
   SOLN: 980°C, 1 hour in argon; AGE: 720°C, 8 hours, furnace cooling down to 620°C; 620°C, 8 hours, cooling in air

PARAMETER COMPARISON



Spider Plot is generated by normalizing typical material data (containing both horizontal and vertical data) against a range defined for each material family. For nickel-based superalloys, the ranges are as follows: UTS: 0-1600 MPa, 0.2%YS: 0-1400 MPa, Elongation: 0-40 %, Density: 0-100 %, Productivity: 5-30 cm^3/h, Surface Quality (all): 70-5 µm

** Roughness measurements have been performed according to DIN EN ISO 4287 and DIN EN ISO 4288. In general analysis of the surface quality is strongly dependent on the methodology used and therefore deviations might be observed depending on methodology used. Vertical and horizontal sidewalls have been characterized using a tactile system, overhangs using an optical system.

PLATFORM STABILITY

Balanced Parameter

The platform stability build evaluates porosity, roughness and tensile properties across different positions and orientations. To illustrate the position dependency of the M Line, the samples were homogenously distributed across the platform on 30 different positions. Regarding surface quality all sides of the specimen, so all orientations with respect to gas flow and optical system, are included in the analysis. Data shown below is dependent on part & print layout as well as batch chemistry and thus might deviate from “typical values” given on previous pages.
