With the release of ControlST software suite V05.02, the Mark VIe and Mark VIeS System Guides were reorganized to address the wide adoption of the Shared I/O feature. The reorganization also provided for the designation of GE Internal and For Public Disclosure in all user documentation.

Since its introduction in ControlST V04.06, the Shared I/O feature has become a standard in several system designs. Thus, many Mark VIe systems are hybrids that include both Mark VIe and Mark VIeS components. In response to this, the Mark VIeS System Guide (GEH-6722) has been integrated into the Mark VIe System Guide (GEH-6721, Volumes I, II, and III). GEH-6722 is superseded.

Components exclusive to GE turbine and compressor control have been moved from Volume II to Volume III. Additionally, diagnostic alarm information for Mark VIe components has been moved from Volume III to Volumes II and III, as part of each component section.
Volumes I and II are now classified as For Public Disclosure. Volume III for GE turbine and compressor control is classified as GE Internal.
